

Adding a new location

Navigate to the section commented with “CONFIGURE LOCATIONS”.

Don’t forget to update the count of NUMBER_OF_LOCATIONS to the correct total.

Follow this template to add a new location to the system:

```
//Add a location

loadLocation(

    "location_pointcloud_name", //folder name (make it up if no data)
    0, //z offset in-world
    true, //does this location have pointcloud data?
    [0,0], //gps position, only used if no pointcloud data
    function(location) {
        //Add a video (reuse for as many as you want in this location)
        createVideo(
            location, //do not modify
            "filename", //video filename
            "Title", //video title
            0, 0, 0 //Z,X,Y offset (in that order)
        );

        //Environment Info (only call once)
        addEnvInfo(
            location, //do not modify
            "Title", //location title
            "Description", //location description
            ["Point", "Point"] //location bullet points (unlimited)
        );

        //Generate World Web (this must be called in every location)
        generateWorldWeb();
    }
);
```
